

## MIPS Programming Model

Hoon Oh  
University Of Ulsan

# MIPS Memory Layout

---

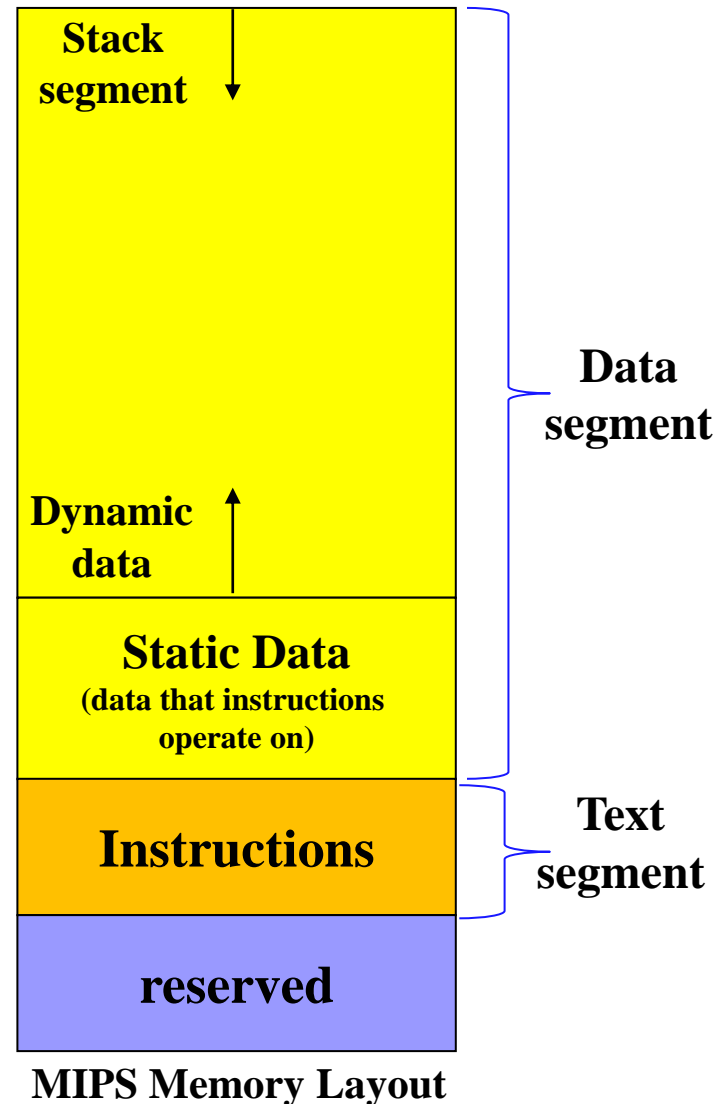

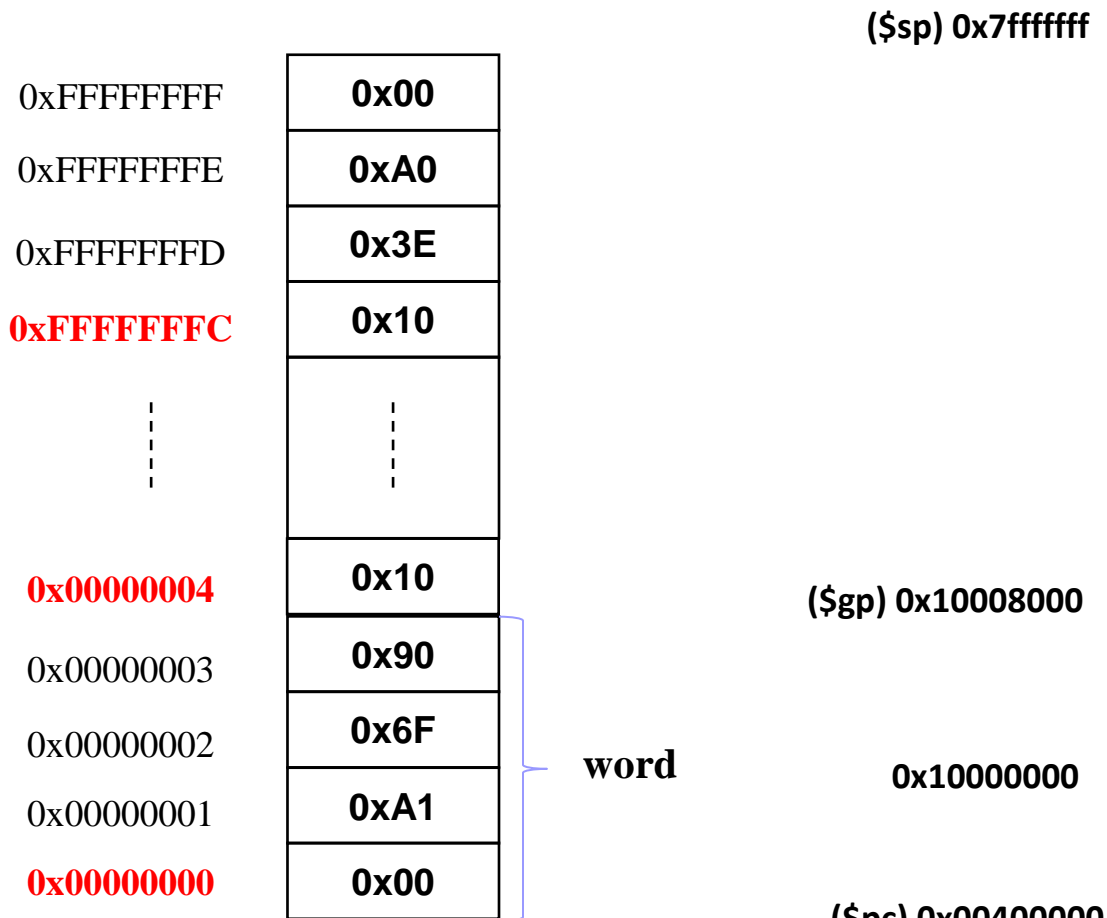

## ■ Memory organization

- Memory consists of a number of cells, each of which holding **one byte**.
- Memory cells are numbered sequentially from **zero** up to the maximum allowable size (**4GB**) (assuming that the machine uses **32-bit address**)

## ■ Address space

- **Text segment**
  - holds instructions for a program
- **Data segment**
  - Static data
  - Dynamic data
    - Grows upward after static data.
- **Stack**
  - Resides in the top of the address space and grows downward.

# MIPS Memory Layout

# MIPS registers

---

- MIPS processor contains 32 general purpose registers (numbered 0 – 31).
- Register  $n$  is designated by  $\$n$  or  $Rn$  (ex,  $R0 = \$0$ ).
- $\$zero$  (0) is always set to 0.
- $\$at$  (1),  $\$k0$  (26) and  $\$k1$  (27) are reserved for use by the assembler and OS.
- $\$v0$  and  $\$v1$  (2, 3) are used for return values.
- $\$t0 - \$t9$  (8-15, 24, 25) are used for temporary values.
- $\$s0 - \$s7$  (16-23) are used for long-lived values.
- $\$gp$ ,  $\$sp$ ,  $\$fp$ ,  $\$ra$  are used for special purposes, as shown in the table of the next page.

# MIPS Registers

Register name	Number	Usage
zero	0	constant 0
at	1	reserved for assembler
v0, v1	2 ~ 3	expression evaluation and results of a function
a0 ~ a3	4 ~ 7	arguments 1 - 4
t0 ~ t7	8 ~ 15	temporary (not preserved across call)
s0 ~ s7	16 ~ 23	saved (preserved across call)
t8, t9	24, 25	temporary (not preserved across call)
k0, k1	26, 27	reserved for OS kernel
gp	28	pointer for global area
sp	29	stack pointer
fp	30	frame pointer
ra	31	return address (used by function call)

# SPIM Simulator

---

## ■ SPIM

- Simulator that runs programs written for MIPS R2000/R3000 processors

## ■ Advantages to using a machine simulator

- MIPS workstation are not generally available.
- Provides better environment for low-level programming than an actual machine:
  - detect more errors
  - provide more features
  - give convenient edit-assemble-load development cycle, compared to using a circuit board.
  - easy to identify and fix the bugs.

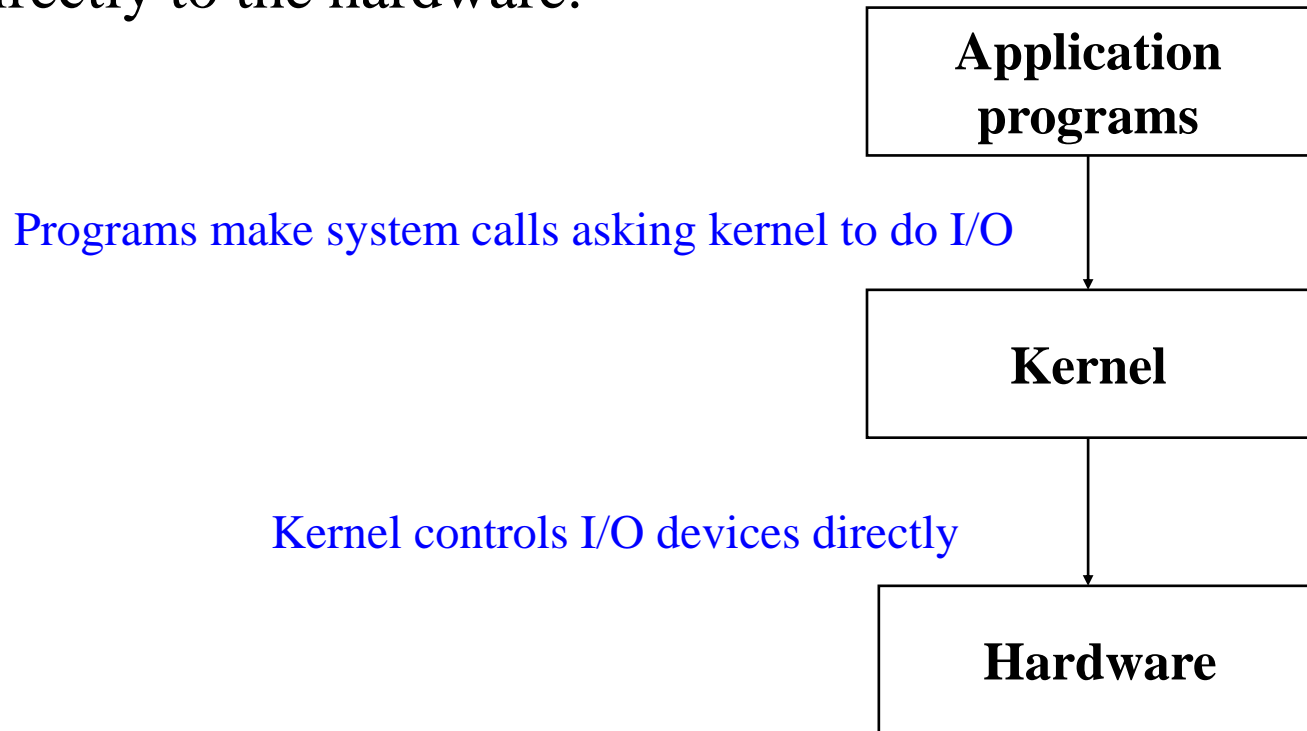

## ■ Disadvantages

- The programs run slower than on a real machine.

# OS system calls

---

- An application program asks the kernel to do I/O by making system calls.
- The kernel implements these system calls by talking directly to the hardware.

# SPIM's system calls

- SPIM provides a small set of 10 OS-like system services through the system call (**syscall**) instruction.

Service	Call code	Arguments	Results
<b>print_int</b>	1	<b>\$a0 = integer</b>	
<b>print_float</b>	2	<b>\$f12 = float</b>	
<b>print_double</b>	3	<b>\$f12 = double</b>	
<b>print_string</b>	4	<b>\$a0 = string</b>	
<b>read_int</b>	5		integer (in \$v0)
<b>read_float</b>	6		float (in \$f0)
<b>read_double</b>	7		double (in \$f0)
<b>read_string</b>	8	<b>\$a0 = buffer, \$a1 = length</b>	
<b>sbrk</b>	9	<b>\$a0 = amount</b>	address (in \$v0)
<b>exit</b>	10		

- **\$v0 : system call code**
- **\$a0...\$a3 : arguments**  
(**\$f12** <- floating point values)
- **syscall** (initiate system service)
- **\$v0 : results**  
(**\$f0**: for the floating point)
- **sbrk** returns the address to a block of memory containing *n* additional bytes. Used for dynamic memory allocation.

# PCSpim(starting)

- Registers window

- Text segment

- Data Segment

- Messages window

The screenshot shows the PCSpim simulator window. The title bar is "PCSpim". The menu bar includes "File", "Simulator", "Window", and "Help". The toolbar contains icons for file operations and simulation. The main window is divided into several sections:

- Registers:** Displays the PC (00000000), EPC (00000000), Cause (00000000), BadVAddr (00000000), Status (00000000), HI (00000000), and LO (00000000). Below this is a table of General Registers (R0-R31) with their names and values, all set to 00000000.
- Text Segment:** Displays assembly code starting at address 0x00400000. The code includes instructions like `lw $4, 0($29)`, `addiu $5, $29, 4`, `addiu $6, $5, 4`, `sll $2, $4, 2`, `addu $6, $6, $2`, `jal 0x00000000 [main]`, and `ori $2, $0, 10`.
- Data Segment:** Displays memory at address 0x10000000 with a value of 0x00000000.
- Stack:** Displays memory at address 0x7ffffeffc with a value of 0x00000000.
- Messages:** Displays version information (SPIM Version 6.3 of December 25, 2000), copyright notices (James R. Larus, David A. Carley, Morgan Kaufmann Publishers, Inc.), and the loaded file path (C:\Program Files\PCSpim\trap.handler).

The status bar at the bottom shows "For Help, press F1" and "PC=0x00000000 EPC=0x00000000 Cause=0x00000000".

# PCSpim(4 Windows)

## ■ Registers window

- shows the values of all registers in the MIPS CPU and FPU

## ■ Text segment

```
[0x00400000] 0x8fa40000 lw $4, 0($29) ; 102 : lw $a0, 0($sp)
```

- address of instruction (hexadecimal)
- instruction's numerical encoding (hexadecimal)
- instruction's mnemonic description
- line number in assembly file
- actual line of assembly file

## ■ Data Segment

- data loaded into program's memory
- data on the program's stack

## ■ Messages window

- messages for SPIM(including error messages)

# PCSpim>Loading, Running, Debugging)

---

## ■ Loading

- File -> Open
- select assembly file

## ■ Running

- Simulator -> Go
- results are displayed in console

## ■ Single step

- Simulator -> Single Step(F10)
- run an instruction at a time

## ■ Multiple steps

- Simulator -> Multiple Step...(F11)
- run given number of instructions at a time

## ■ Breakpoint

- Simulator -> Breakpoints(Ctrl + B)
- stop program immediately before it executes a particular instruction

# Code Format

## ■ Source code format

[label:] operation [operand], [operand], [operand] [#comment]

- Brackets ([ ]) indicates an optional field.

## ■ Constants

- Hex numbers: prefix with 0x
- String: “hello world\n”
- Special characters: \n (newline), \t (tab), \" (quote).
- SPIM directives for character strings

.ascii “abcd” : do not null-terminate them.

a	b	c	d	?	?
---	---	---	---	---	---

.asciiz “abcd” : null-terminate them.

a	b	c	d	\0	?
---	---	---	---	----	---

# Code Format: hello.a

```
1  ## hello.a - prints out "hello world"
2  ##          a0 - points to the string
3  #####
4  #                      text segment                      #
5  #####
6      .text
7      .globl  __start
8  __start:                # execution starts here
9      la $a0, str          # put string address into a0
10     li $v0, 4             # system call to print
11     syscall              # out a string
12
13     li $v0, 10
14     syscall              # au revoir (goodbye) ...
15 #####
16 #                      data segment                      #
17 #####
18     .data
19     str: .asciiz "hello world\n"
20     ##
21     ## end of file hello.a
```

# PC-SPIM for Windows

- Registers window

- Text segment

- Data Segment

- Messages window

The screenshot shows the PCSpim simulator interface. The title bar is 'PCSpim'. The menu bar includes 'File', 'Simulator', 'Window', and 'Help'. The toolbar contains icons for file operations and simulation control. The main window is divided into several sections:

- Registers:** Displays the status of various registers. General registers R0-R31 are shown with their names and values. Floating point registers FP0-FP31 are also shown.
- Text Segment:** Displays assembly code instructions with their addresses. The instructions shown are:
  - [0x00400010] 0x00c23021 addu \$6, \$6, \$2
  - [0x00400014] 0x0c000000 jal 0x00000000 [main]
  - [0x00400018] 0x3402000a ori \$2, \$0, 10
- Data Segment:** Displays data values. The data shown is:
  - [0x10000000]...[0x10040000] 0x00000000
- Stack:** Displays stack values. The stack shown is:
  - [0x7ffffeffc] 0x00000000
- Messages:** Displays version information and copyright notices. The messages shown are:
  - SPIM Version 6.3 of December 25, 2000
  - Copyright 1990-2000 by James R. Larus (larus@cs.wisc.edu).
  - All Rights Reserved.
  - DOS and Windows ports by David A. Carley (dac@cs.wisc.edu).
  - Copyright 1997 by Morgan Kaufmann Publishers, Inc.
  - See the file README for a full copyright notice.
  - Loaded: C:\Program Files\PCSpim\trap.handler

The status bar at the bottom shows 'For Help, press F1' and the current register values: 'PC=0x00000000 EPC=0x00000000 Cause=0x00000000'.

```

# STUDY-AID1

---

- There exists one bug in math1.a. Using step button, check the contents of the following registers after executing the fifth line (`lw $t1, A`).
- PC, t0, t1, gp, sp
- Check the following registers before and after executing the 10<sup>th</sup> line (`mul $t5, $2, $t0`).
  - PC
  - t4, t5
  - Check whether or not the content of t5  $B * X = 4 \times 7 = 28$  (0x1C) after execution?
- Check if the value is 180 after modifying the error.

# STUDY-AID2

---

- Write and run the assembly program that computes  $5 * X^2 - 3$  (use hw1-math2.a).  
Assign X to 7  
Output: Answer = 242

# STUDY-AID3

---

- Write and run the assembly program that compute  $(\text{NUM}-3)*(\text{NUM}+4)$  (use hw2-math3.a).

Assign NUM to 10

Output: Answer = 98

# STUDY-AID4

---

- Write and run the recursive program for Fibonacci function (use hw3-fib-recursive.a)

# STUDY-AID5

---

- What is the relationship between machine language and Assembly?
- What are the advantages of Assembly programming compared to C programming?
- Show the procedure regarding how the computer perform  $5 - 3$ .
  - Note that computer can perform ADD only.
- What is the role of program counter?
- What is the rule in making an identifier in SPIM?
- What are the difference between syntax error and logical error?
- What is the purpose of using single stepping in SPIM?
- What is the breakpoint in SPIM?
- What are the objectives of hi and lo registers?
- State the differences of la, lb, li, and lw.
